Generative Models

PixelRNN

Variational Autoencoder (VAE)

Generative Adversarial Network
(GAN)

PixelRNN

Ref: Aaron van den Oord, Nal Kalchbrenner, Koray Kavukcuoglu, Pixel Recurrent Neural Networks, arXiv preprint, 2016

- To create an image, generating a pixel each time

E.g. 3 x 3 images

Can be trained just with a large collection of images without any annotation

PixelRNN

Ref: Aaron van den Oord, Nal Kalchbrenner, Koray Kavukcuoglu, Pixel Recurrent Neural Networks, arXiv preprint, 2016

Real
World

More than images

Practicing Generation Models: Pokémon Creation

- Small images of 792 Pokémon's
 - Can machine learn to create new Pokémons?

Don't catch them! Create them!

- Source of image:
[http://bulbapedia.bulbagarden.net/wiki/List_of_Pok%C3%A9mon_by_base_stats_\(Generation_VI\)](http://bulbapedia.bulbagarden.net/wiki/List_of_Pok%C3%A9mon_by_base_stats_(Generation_VI))

Original image is 40 x 40

Making them into 20 x 20

Practicing Generation Models: Pokémon Creation

- Tips (?)

- Each pixel is represented by 3 numbers (corresponding to RGB)

R=50, G=150, B=100

- Each pixel is represented by a 1-of-N encoding feature

Clustering the similar color  167 colors in total

Practicing Generation Models: Pokémon Creation

- Original image (40 x 40):
http://speech.ee.ntu.edu.tw/~tlkagk/courses/ML_2016/Pokemon_creation/image.rar
- Pixels (20 x 20):
http://speech.ee.ntu.edu.tw/~tlkagk/courses/ML_2016/Pokemon_creation/pixel_color.txt
 - Each line corresponds to an image, and each number corresponds to a pixel
 - http://speech.ee.ntu.edu.tw/~tlkagk/courses/ML_2016/Pokemon_creation/colormap.txt

Why VAE?

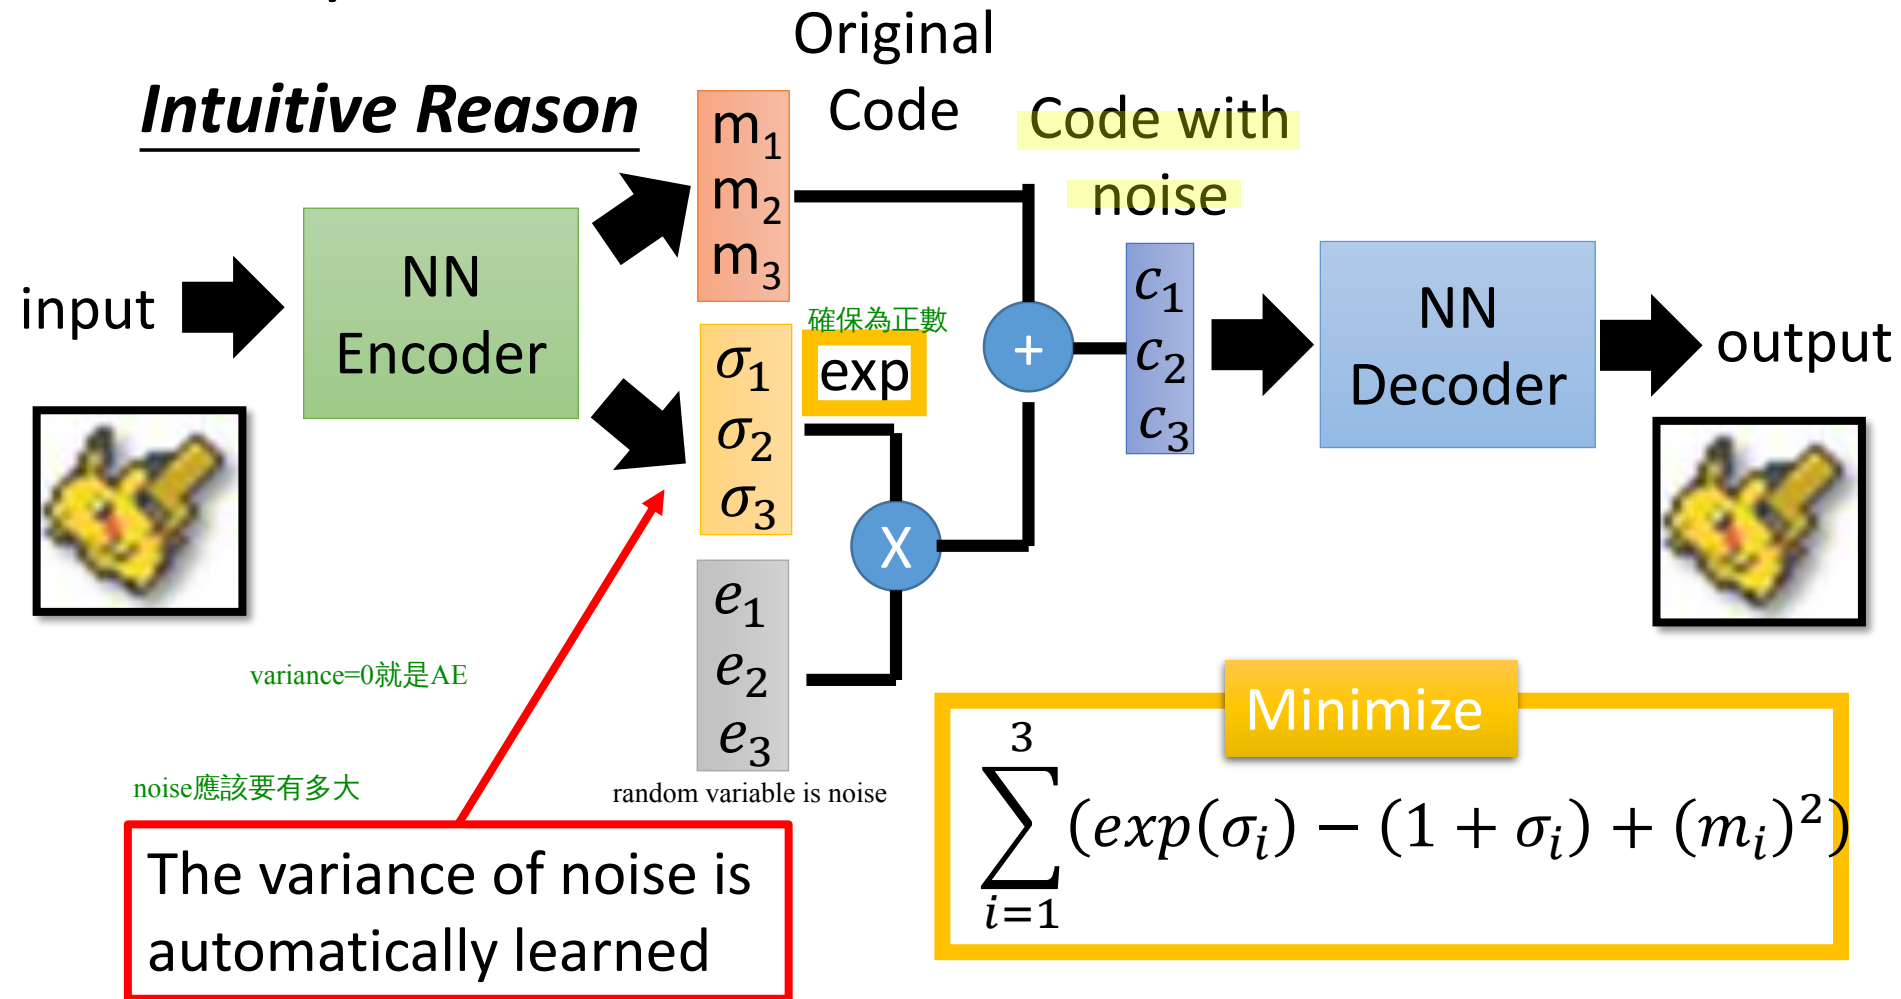

Intuitive Reason

Why VAE?

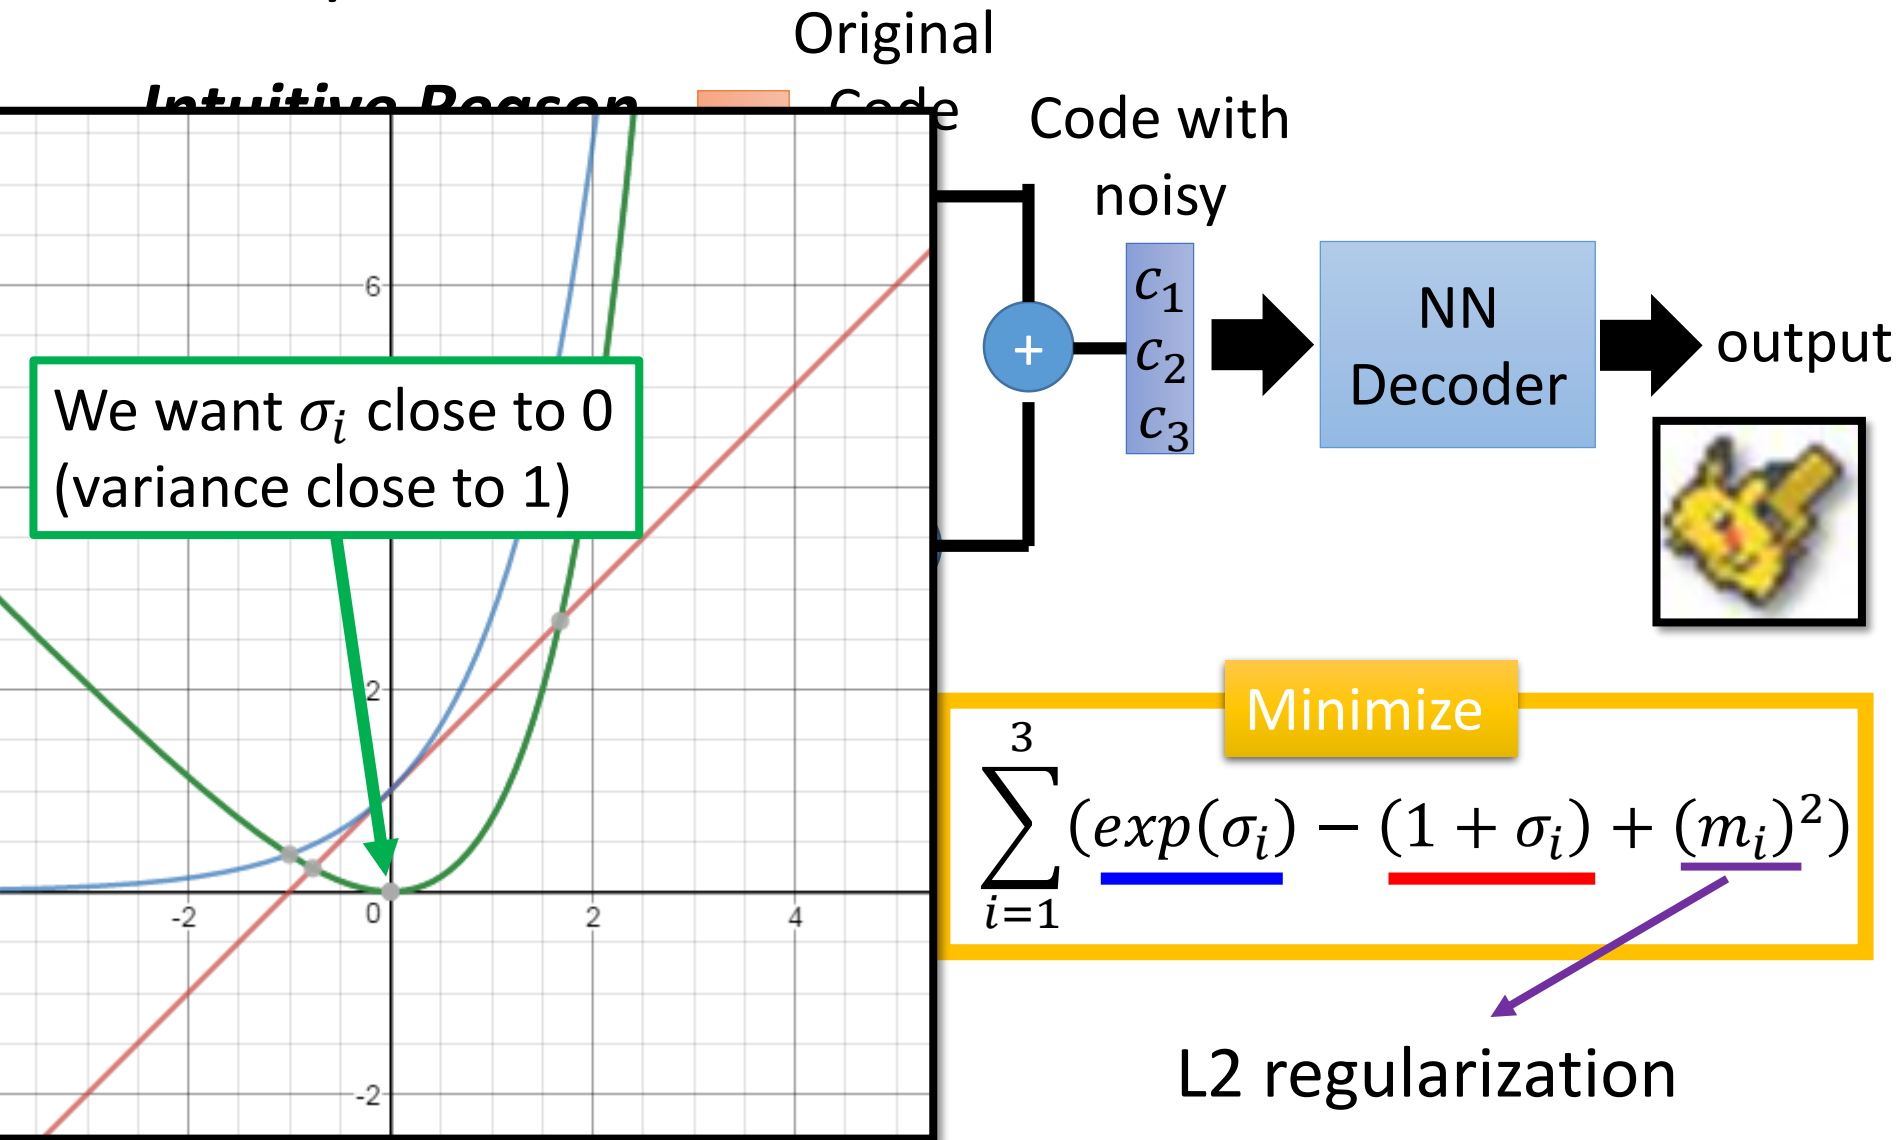

What will happen if we only minimize reconstruction error?

Intuitive Reason

Why VAE?

What will happen if we only minimize reconstruction error?

Why VAE?

- Back to what we want to do

高維空間 機率分布

Estimate the probability distribution

$P(x)$

Each Pokémon is a point x in the space

Gaussian Mixture Model

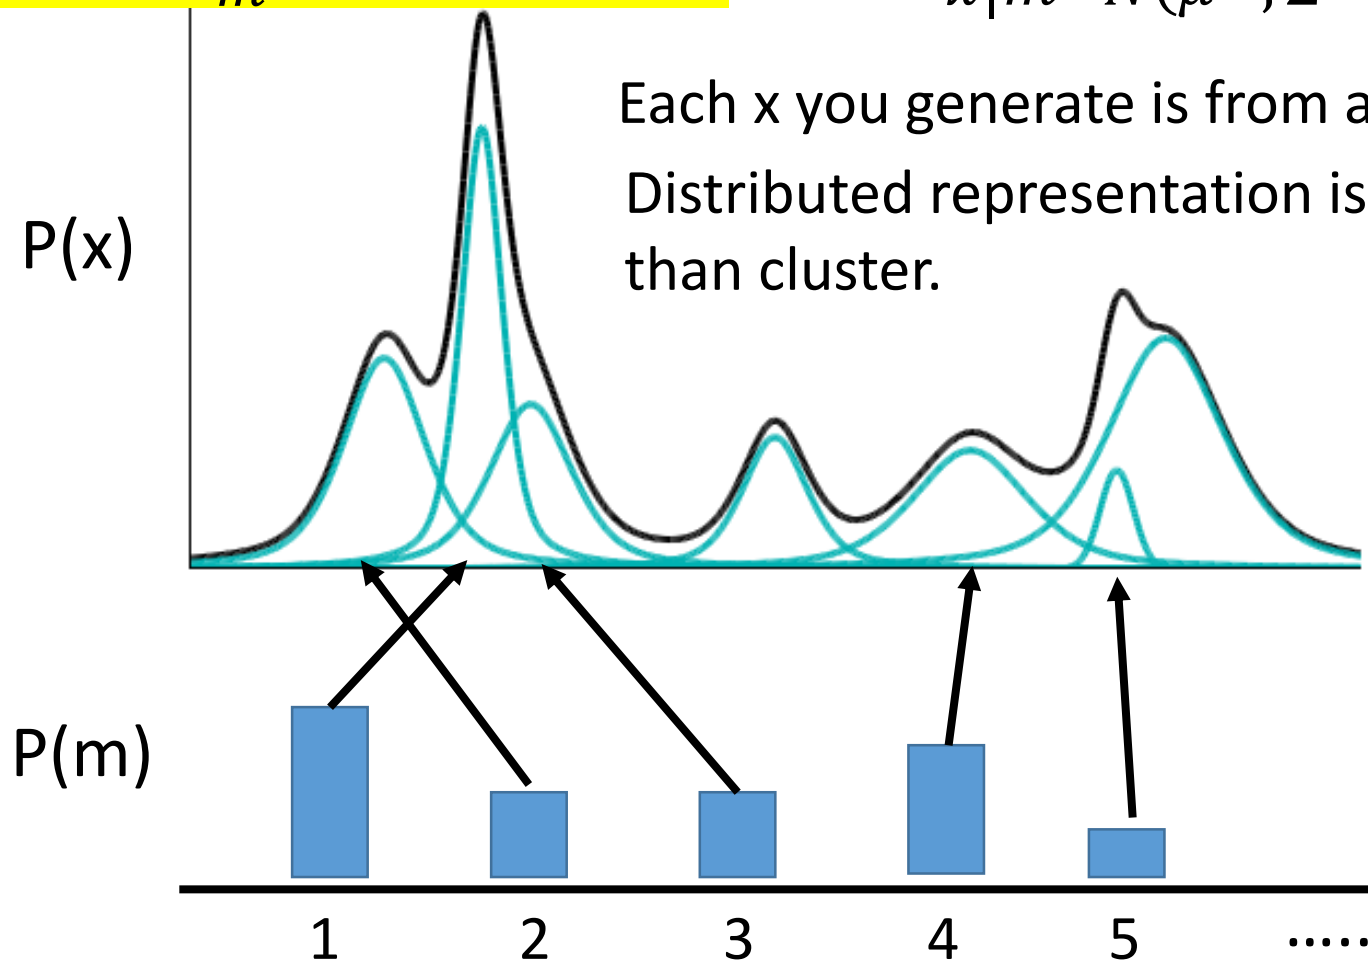

How to sample?

$m \sim P(m)$ (multinomial)

m is an integer

$x|m \sim N(\mu^m, \Sigma^m)$

$$P(x) = \sum_m P(m)P(x|m)$$

VAE

$$z \sim N(0, I)$$

z is a vector from normal distribution

$$x|z \sim N(\mu(z), \sigma(z))$$

Each dimension of z
represents an attribute

Maximizing Likelihood

$$P(x) = \int_z P(z)P(x|z)dz$$

$$L = \sum_x \log P(x)$$

Maximizing the likelihood of the observed x

$P(z)$ is normal distribution

$$x|z \sim N(\mu(z), \sigma(z))$$

$\mu(z), \sigma(z)$ is going to be estimated

Tuning the parameters to maximize likelihood L

We need another distribution $q(z|x)$

$$z|x \sim N(\mu'(x), \sigma'(x))$$

Maximizing Likelihood

$P(z)$ is normal distribution

$x|z \sim N(\mu(z), \sigma(z))$

$\mu(z), \sigma(z)$ is going to be estimated

$$P(x) = \int_z P(z) P(x|z) dz$$

$$L = \sum_x \log P(x) \quad \text{Maximizing the likelihood of the observed } x$$

$$\log P(x) = \int_z q(z|x) \log P(x) dz \quad q(z|x) \text{ can be any distribution}$$

$$= \int_z q(z|x) \log \left(\frac{P(z, x)}{P(z|x)} \right) dz = \int_z q(z|x) \log \left(\frac{P(z, x)}{q(z|x)} \frac{q(z|x)}{P(z|x)} \right) dz$$

$$= \int_z q(z|x) \log \left(\frac{P(z, x)}{q(z|x)} \right) dz + \underbrace{\int_z q(z|x) \log \left(\frac{q(z|x)}{P(z|x)} \right) dz}_{KL(q(z|x) || P(z|x))}$$

$$\geq \int_z q(z|x) \log \left(\frac{P(x|z) P(z)}{q(z|x)} \right) dz \quad \text{lower bound } L_b$$

≥ 0

Maximizing Likelihood

$$\log P(x) = L_b + KL(q(z|x) || P(z|x))$$

$$L_b = \int_z q(z|x) \log \left(\frac{P(x|z)P(z)}{q(z|x)} \right) dz$$

Find $P(x|z)$ and $q(z|x)$
maximizing L_b

$q(z|x)$ will be an approximation of $p(z|x)$ in the end

Maximizing Likelihood

$P(z)$ is normal distribution

$x|z \sim N(\mu(z), \sigma(z))$

$\mu(z), \sigma(z)$ is going to be estimated

$$P(x) = \int_z P(z)P(x|z)dz$$

$$L = \sum_x \log P(x)$$

Maximizing the likelihood of the observed x

$$L_b = \int_z q(z|x) \log \left(\frac{P(z, x)}{q(z|x)} \right) dz = \int_z q(z|x) \log \left(\frac{P(x|z)P(z)}{q(z|x)} \right) dz$$

$$= \int_z \underbrace{q(z|x) \log \left(\frac{P(z)}{q(z|x)} \right)}_{-KL(q(z|x)||P(z))} dz + \int_z q(z|x) \log P(x|z) dz$$

$z|x \sim N(\mu'(x), \sigma'(x))$

Connection with Network

Minimizing $KL(q(z|x)||P(z))$

Minimize

$$\sum_{i=1}^3 (\exp(\sigma_i) - (1 + \sigma_i) + (m_i)^2)$$

(Refer to the Appendix B of the original VAE paper)

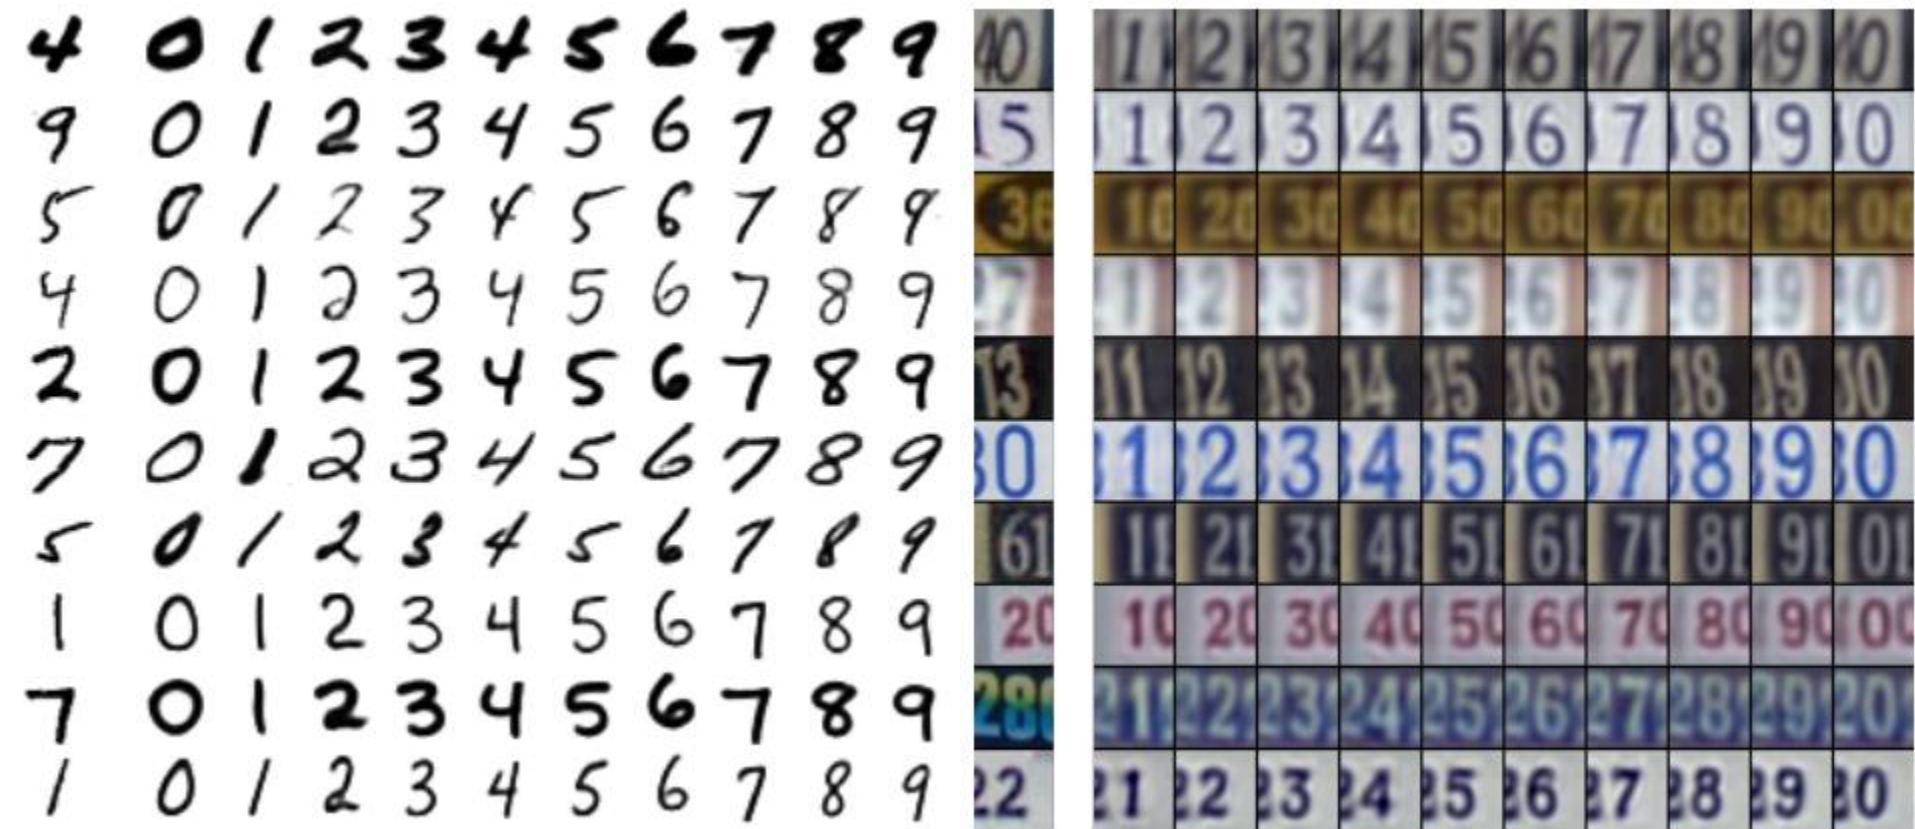

Maximizing

$$\int_z q(z|x) \log P(x|z) dz = E_{q(z|x)}[\log P(x|z)]$$

This is the auto-encoder

Conditional VAE

 - <http://fvae.ail.tokyo/>

Problems of VAE

- It does not really try to simulate real images

VAE may just memorize the existing images, instead of generating new images

Yann LeCun's comment

What are some recent and potentially upcoming breakthroughs in unsupervised learning?

Yann LeCun, Director of AI Research at Facebook and Professor at NYU

Written Jul 29 · Upvoted by Joaquin Quiñonero Candela, Director Applied Machine Learning at Facebook and Huang Xiao

Adversarial training is the coolest thing since sliced bread.

I've listed a bunch of relevant papers in a previous answer.

Expect more impressive results with this technique in the coming years.

What's missing at the moment is a good understanding of it so we can make it work reliably. It's very finicky. Sort of like ConvNet were in the 1990s, when I had the reputation of being the only person who could make them work (which wasn't true).

Yann LeCun's comment

What are some recent and potentially upcoming breakthroughs in deep learning?

Yann LeCun, Director of AI Research at Facebook and Professor at NYU

Written Jul 29 · Upvoted by Joaquin Quiñero Candela, Director Applied Machine Learning at Facebook and Nikhil Garg, I lead a team of Quora engineers working on ML/NLP problems

.....

The most important one, in my opinion, is adversarial training (also called GAN for Generative Adversarial Networks). This is an idea that was originally proposed by Ian Goodfellow when he was a student with Yoshua Bengio at the University of Montreal (he since moved to Google Brain and recently to OpenAI).

This, and the variations that are now being proposed is the most interesting idea in the last 10 years in ML, in my opinion.

In practical

- GANs are difficult to optimize.
- No explicit signal about how good the generator is
 - In standard NNs, we monitor loss
 - In GANs, we have to keep “well-matched in a contest”
- When discriminator fails, it does not guarantee that generator generates realistic images
 - Just because discriminator is stupid
 - Sometimes generator find a specific example that can fail the discriminator
 - Making discriminator more robust may be helpful.
