Imitation Learning

Introduction

1. WHY IMITATION LEARNING?

- Imitation Learning
  - Also known as learning by demonstration, apprenticeship learning
- An expert demonstrates how to solve the task
  - Machine can also interact with the environment, but cannot explicitly obtain reward.
  - It is hard to define reward in some tasks.
  - Hand-crafted rewards can lead to uncontrolled behavior
- Two approaches:
  - Behavior Cloning
  - Inverse Reinforcement Learning (inverse optimal control)

Behavior Cloning

Behavior Cloning

Yes, this is supervised learning.

- Self-driving cars as example

observation

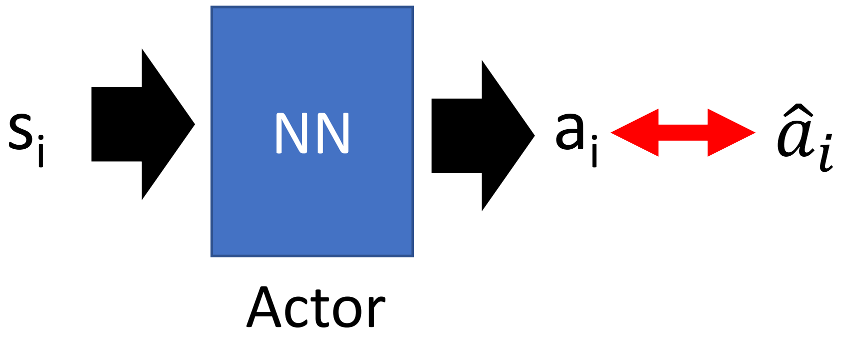
Expert (Human driver): 向前

Machine: 向前

機器學習expert的行為

Training data:

$(s_1, \hat{a}_1)$
$(s_2, \hat{a}_2)$
$(s_3, \hat{a}_3)$
……



Behavior Cloning

- Problem

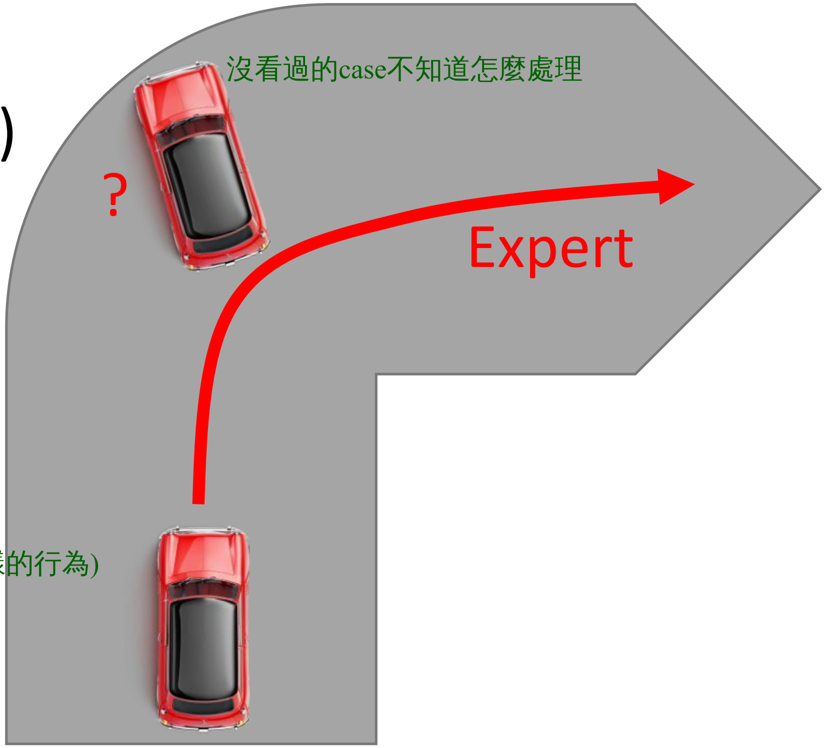
Expert only samples limited observation (states)

看過的observation是有限的

Let the expert in the states seem by machine

需要蒐集更多樣性的data(在各種極端的情況下會做出怎樣的行為)

Dataset Aggregation



Behavior Cloning

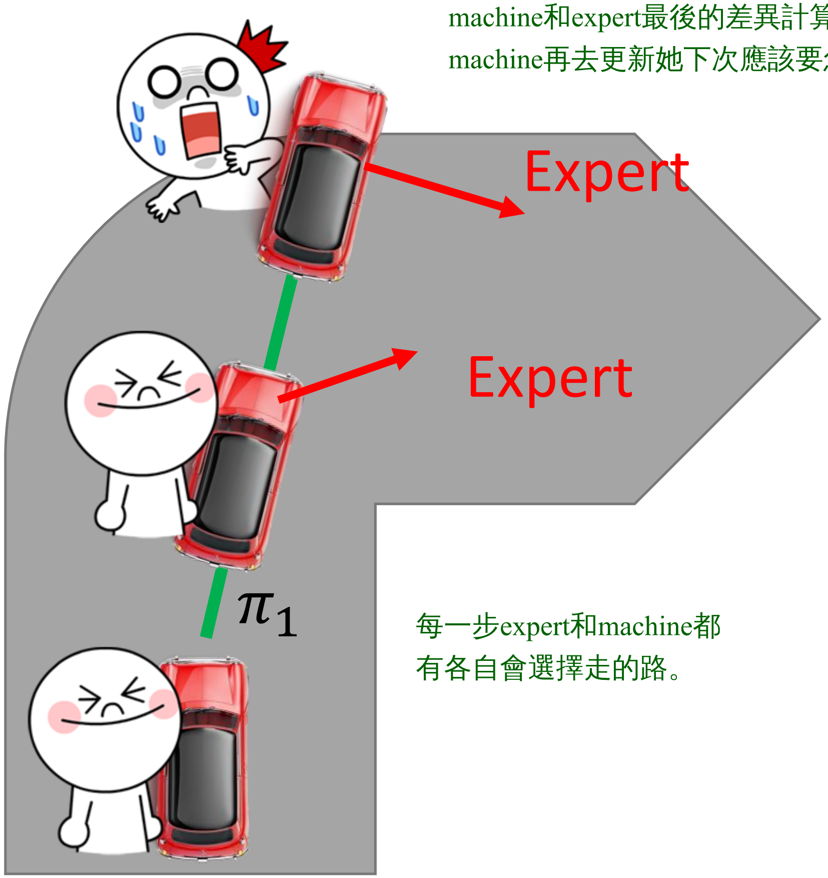
- Dataset Aggregation

Get actor π_1 by behavior cloning

Using π_1 to interact with the environment

Ask the expert to label the observation of π_1

Using new data to train π_2



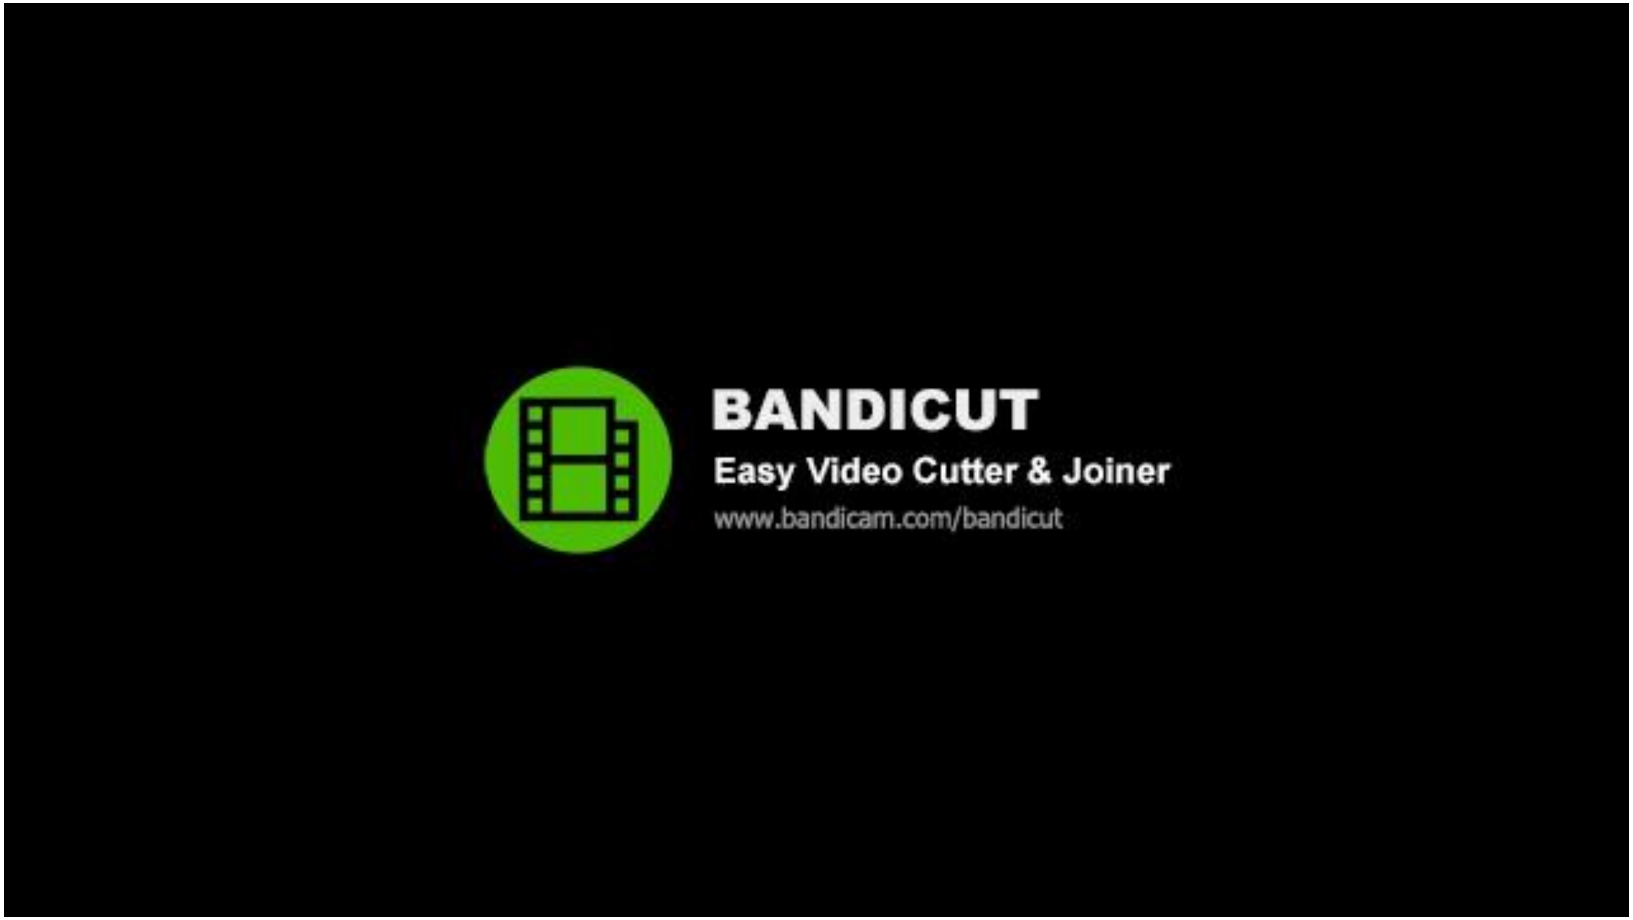
machine和expert最後的差異計算loss，
machine再去更新她下次應該要怎麼走

每一步expert和machine都
有各自會選擇走的路。

expert本身無用的習慣也會被學習

Behavior Cloning

The agent will copy every behavior, even irrelevant actions.

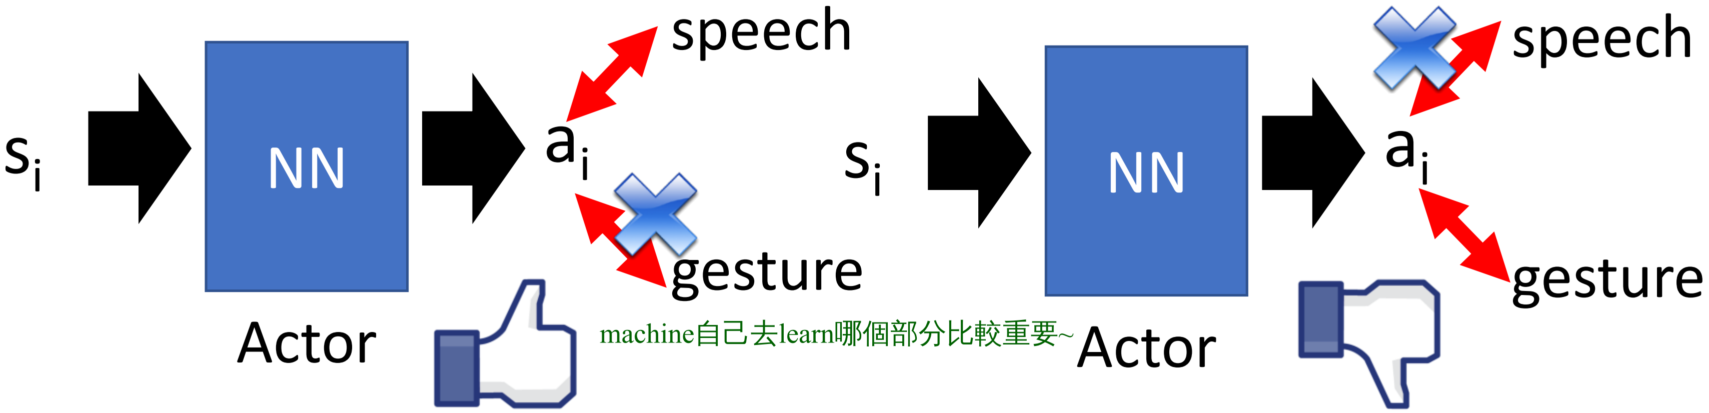


https://www.youtube.com/watch?v=j2FSB3bseek

Behavior Cloning

缺點: capacity有限: 因此甚麼該學甚麼不該學是該分重要程度的

- Major problem: if machine has limited capacity, it may choose the wrong behavior to copy.



machine自己去learn哪個部分比較重要~

- Some behavior must copy, but some can be ignored.
    - Supervised learning takes all errors equally

沒有區分那些重要那些不重要

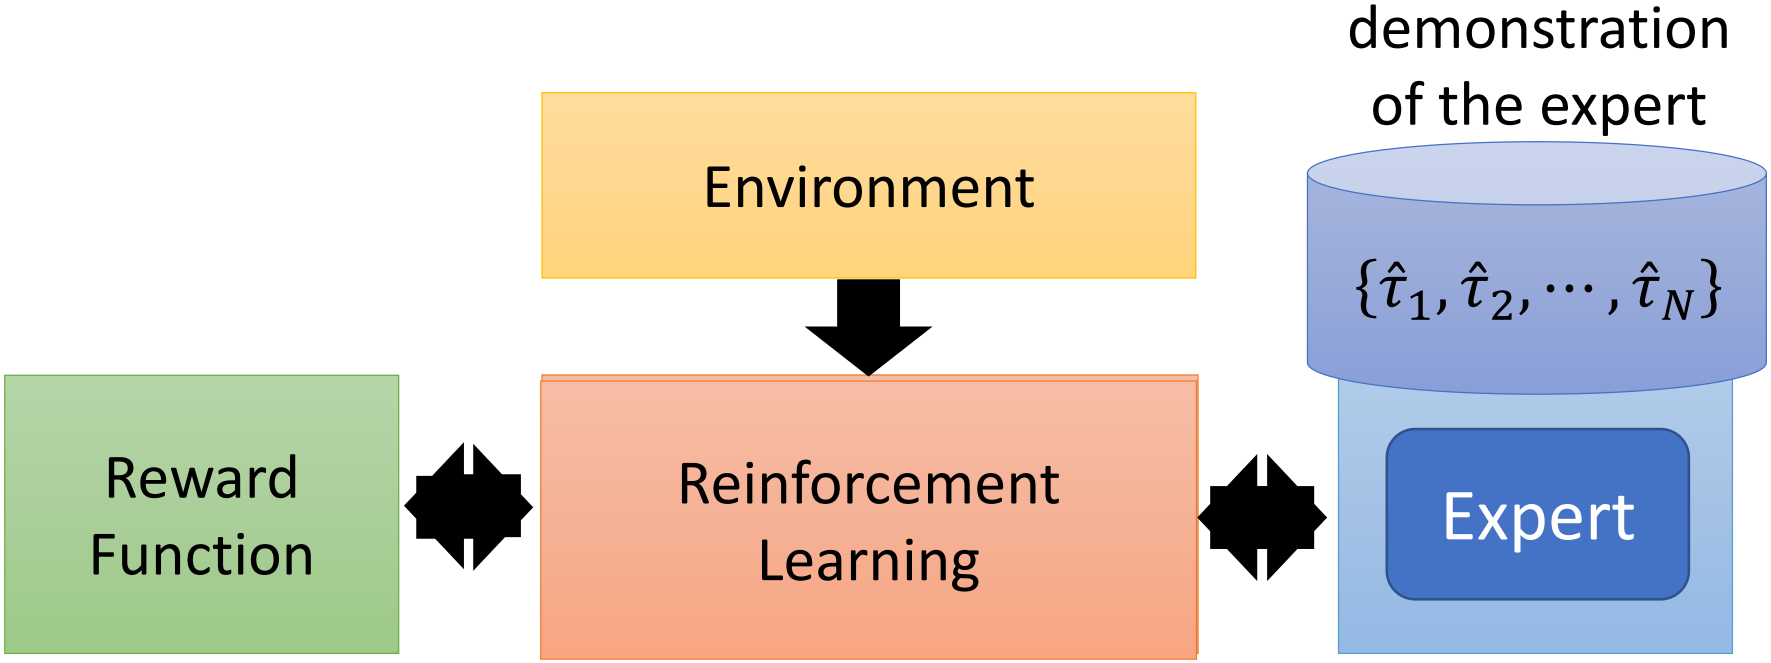
Mismatch

- In supervised learning, we expect training and testing data have the same distribution.
- In behavior cloning:
  - Training: $(s, a) \sim \hat{\pi}$ (expert)
    - ***Action a taken by actor influences the distribution of s***
  - Testing: $(s', a') \sim \pi^*$ (actor cloning expert)
    - If $\hat{\pi} = \pi^*$, (s, a) and (s', a') from the same distribution
    - If $\hat{\pi}$ and π^* have difference, the distribution of s and s′ can be very different.

失之毫釐差之千里

Inverse Reinforcement Learning (IRL)

Inverse Reinforcement Learning



demonstration of the expert
Environment
$\{\hat{\tau}_1, \hat{\tau}_2, \cdots, \hat{\tau}_N\}$
Reward Function
Reinforcement Learning
Expert

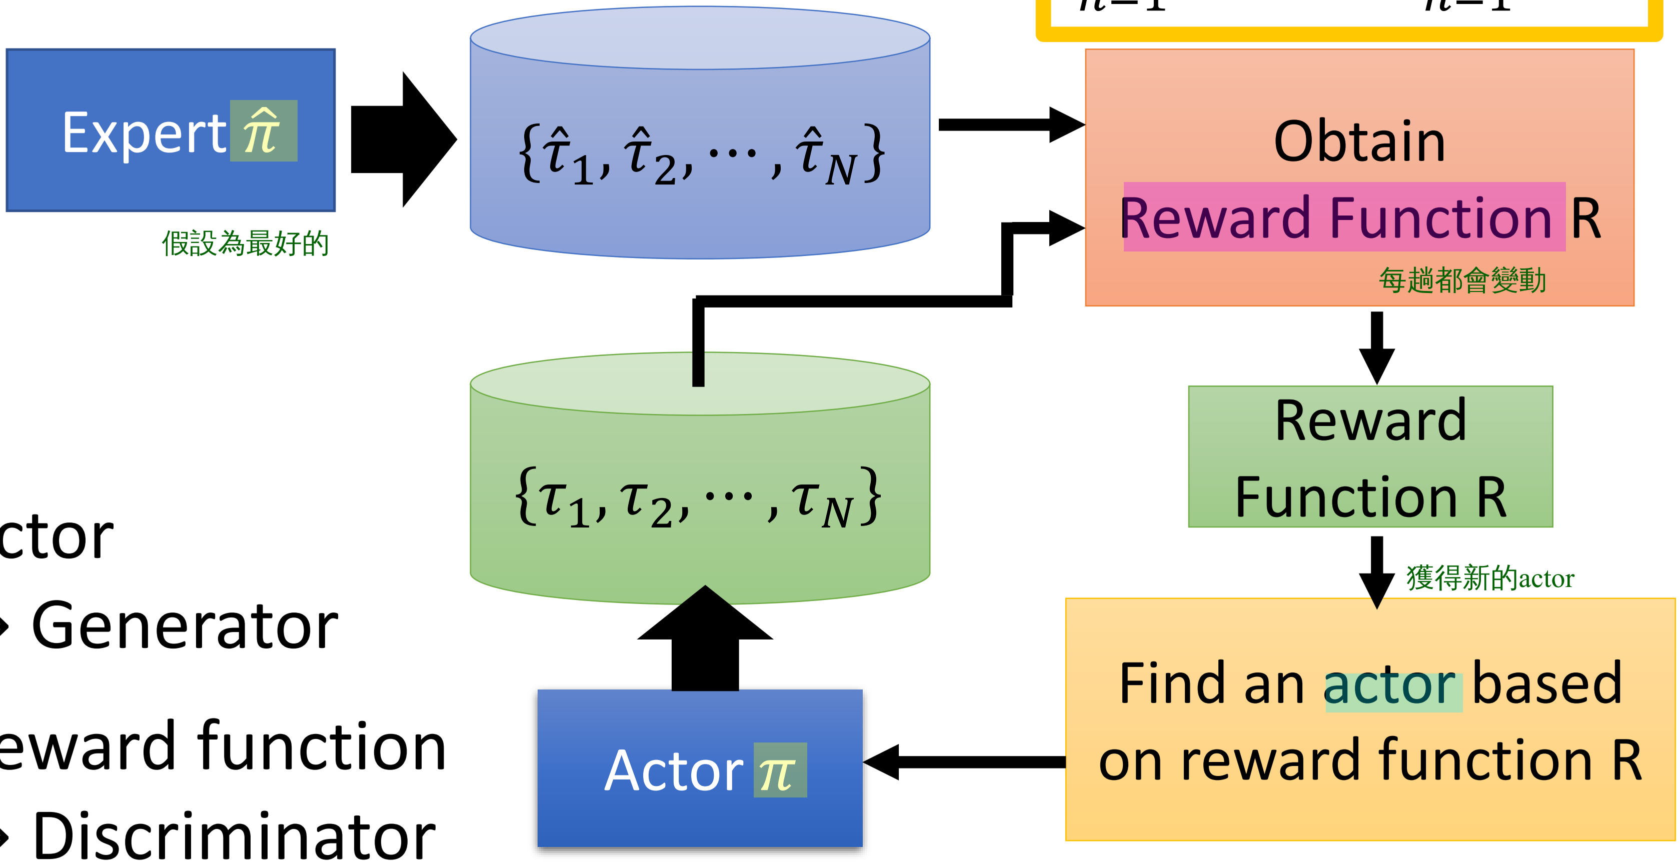
也許reward function很簡單，卻可以呈現很複雜的行為

- ➢ Using the reward function to find the ***optimal actor***.
- ➢ Modeling reward can be easier. Simple reward function can lead to complex policy.

Framework of IRL

The expert is always the best.

$$\sum_{n=1}^{N} R(\hat{\tau}_n) > \sum_{n=1}^{N} R(\tau)$$



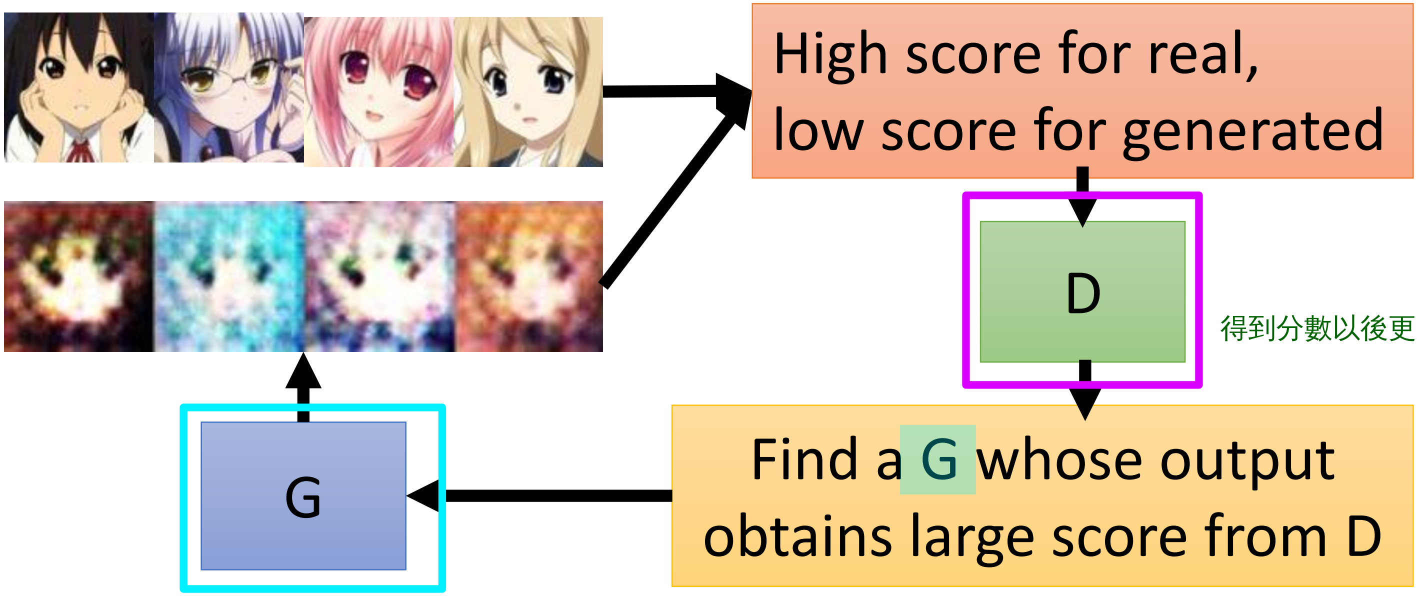
By Reinforcement learning

Actor
→ Generator

Reward function
→ Discriminator

GAN

有！正確答案



High score for real, low score for generated

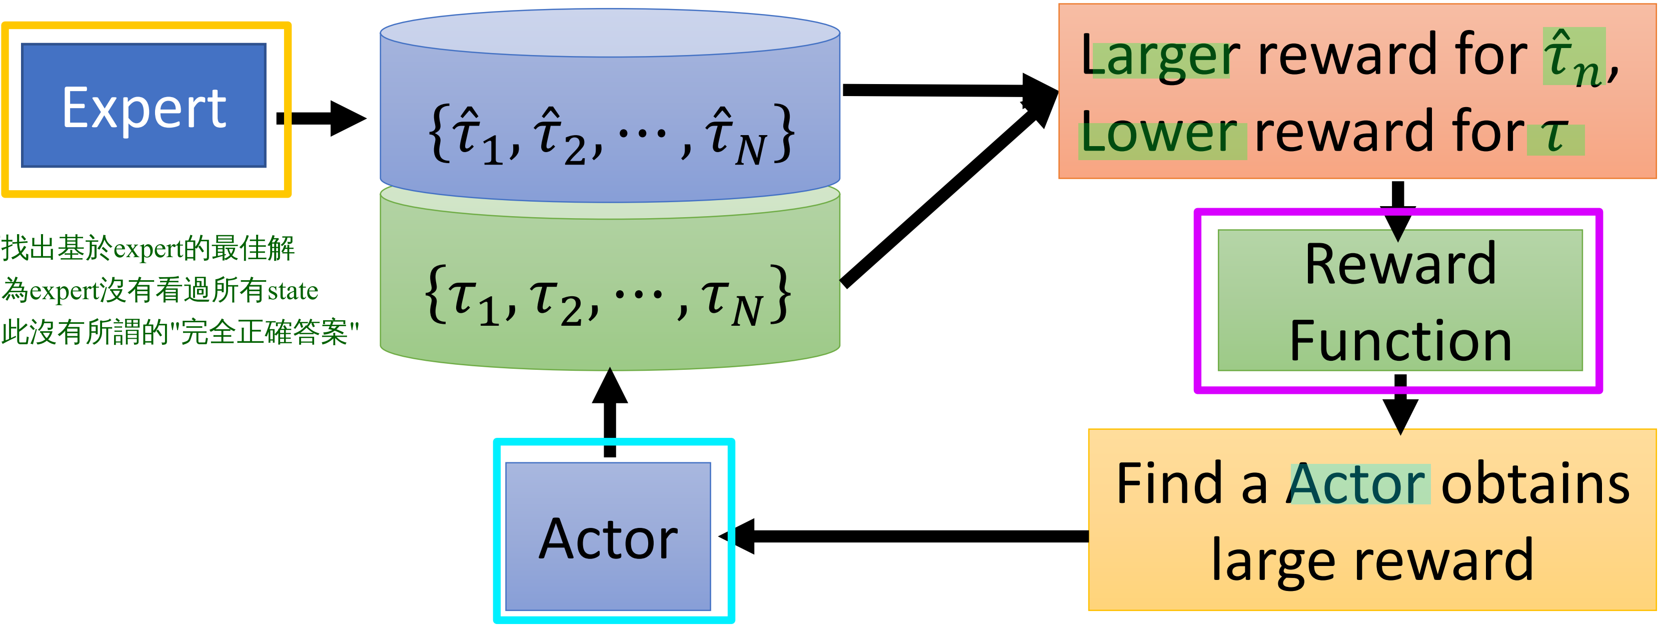
D

Find a G whose output obtains large score from D

G

得到分數以後更新G

IRL



Expert

$\{\hat{\tau}_1, \hat{\tau}_2, \cdots, \hat{\tau}_N\}$

$\{\tau_1, \tau_2, \cdots, \tau_N\}$

Larger reward for $\hat{\tau}_n$, Lower reward for τ

Reward Function

Find a Actor obtains large reward

Actor

可找出基於expert的最佳解
因為expert沒有看過所有state
因此沒有所謂的"完全正確答案"

Parking Lot Navigation

- Reward function:
  - Forward vs. reverse driving
  - Amount of switching between forward and reverse
  - Lane keeping
  - On-road vs. off-road
  - Curvature of paths

Third Person Imitation Learning

o_t
o_{t+4}
$\frac{\partial L_E}{\partial \theta_F}$
$\frac{\partial L_E}{\partial \theta_E}$
Loss L_E
Input o_{t+4}
Input o_t
o_{t+4} features
o_t features
concat
Expert vs. Non-expert Label E
TRPO
$\nabla \pi (E, o_t)$
Domain Label D
Feature Extractor F
$- \frac{\partial L_D}{\partial \theta_F}$
$\frac{\partial L_D}{\partial \theta_E}$
Loss L_D

Recap: Sentence Generation & Chat-bot

Sentence Generation

Expert trajectory:
床 前 明 月 光

(s_1, a_1): (“<BOS>”,”床”)

(s_2, a_2): (“床”,”前”)

(s_3, a_3): (“床前”,”明”)

⋮ ⋮

Chat-bot

Expert trajectory:
input: how are you
Output: I am fine

(s_1, a_1): (“input, <BOS>”,”I”)

(s_2, a_2): (“input, I”, ”am”)

(s_3, a_3): (“input, I am”, ”fine”)

⋮ ⋮

Maximum likelihood is behavior cloning. Now we have better approach like SeqGAN.
